Artificial Intelligent – Week 9

Dr Salem Ameen

S.A.AMEEN1@SALFORD.AC.UK

Week 9: Artificial Intelligent – Machine Learning

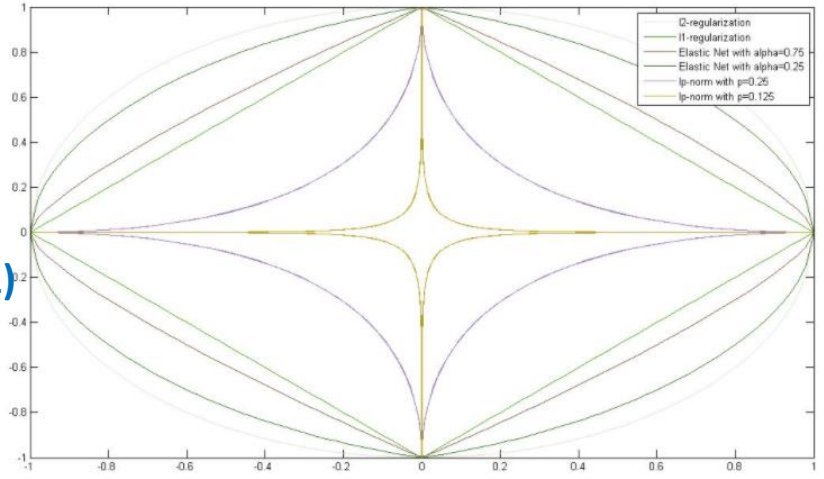
University of Salford MANCHESTER

Loss and Regularizer	Comments
Ordinary Least Squares $\min_{\mathbf{w}} \frac{1}{n}\sum_{i=1}^{n}(\mathbf{w}^\top x_i - y_i)^2$	◦ Squared Loss ◦ No Regularization ◦ Closed form solution: ◦ $\mathbf{w} = (\mathbf{X}\mathbf{X}^\top)^{-1}\mathbf{X}\mathbf{y}^\top$ ◦ $\mathbf{X} = [\mathbf{x}_1, \ldots, \mathbf{x}_n]$ ◦ $\mathbf{y} = [y_1, \ldots, y_n]$
Ridge Regression $\min_{\mathbf{w}} \frac{1}{n}\sum_{i=1}^{n}(\mathbf{w}^\top x_i - y_i)^2 + \lambda\|w\|_2^2$	◦ Squared Loss ◦ l_2-Regularization ◦ $\mathbf{w} = (\mathbf{X}\mathbf{X}^\top + \lambda\mathbb{I})^{-1}\mathbf{X}\mathbf{y}^\top$
Lasso $\min_{\mathbf{w}} \frac{1}{n}\sum_{i=1}^{n}(\mathbf{w}^\top \mathbf{x}_i - y_i)^2 + \lambda\|\mathbf{w}\|_1$	◦ + sparsity inducing (good for feature selection) ◦ + Convex ◦ - Not strictly convex (no unique solution) ◦ - Not differentiable (at 0) ◦ Solve with (sub)-gradient descent or SVEN
Elastic Net $\min_{\mathbf{w}} \frac{1}{n}\sum_{i=1}^{n}(\mathbf{w}^\top \mathbf{x}_i - y_i)^2 + \alpha\|\mathbf{w}\|_1 + (1-\alpha)\|\mathbf{w}\|_2^2$ $\alpha \in [0, 1)$	◦ ADVANTAGE: Strictly convex (i.e. unique solution) ◦ + sparsity inducing (good for feature selection) ◦ + Dual of squared-loss SVM, see SVEN ◦ DISADVANTAGE: - Non-differentiable

$$\min_{\mathbf{w}} \frac{1}{n}\sum_{i=1}^{n} \underbrace{l(h_{\mathbf{w}}(\mathbf{x}_i), y_i)}_{\text{Loss}} + \underbrace{\lambda r(w)}_{\text{Regularizer}},$$

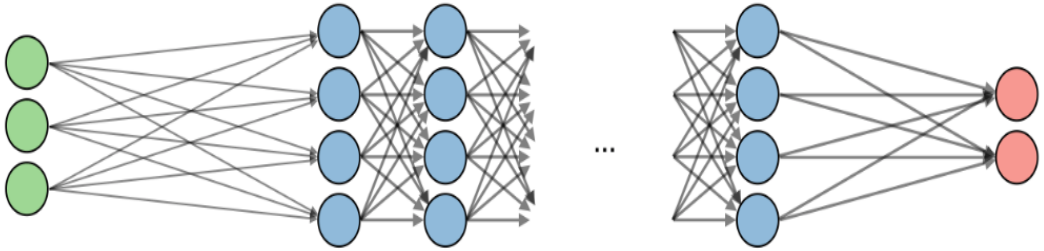
Loss and Regularizer	Comments
Logistic Regression $\min_{\mathbf{w},b} \frac{1}{n}\sum_{i=1}^{n}\log\left(1 + e^{-y_i(\mathbf{w}^\top \mathbf{x}_i + b)}\right)$	◦ Often l_1 or l_2 Regularized ◦ Solve with gradient descent. ◦ $\Pr(y\|x) = \frac{1}{1+e^{-y(\mathbf{w}^\top x + b)}}$
Linear Support Vector Machine $\min_{\mathbf{w},b} C\sum_{i=1}^{n}\max[1 - y_i(\mathbf{w}^\top \mathbf{x}_i + b), 0] + \|\mathbf{w}\|_2^2$	◦ Typically l_2 regularized (sometimes l_1). ◦ Quadratic program. ◦ When kernelized leads to **sparse** solutions. ◦ Kernelized version can be solved very efficiently with specialized algorithms (e.g. SMO)

tf.keras.regularizers.L1(0.3)
tf.keras.regularizers.L2(0.1)
tf.keras.regularizers.L1L2(l1=0.01, l2=0.01)



Week 9: Artificial Intelligent – Deep Learning

Features									output
x1	x2	x3	x4	x5	x6	x6	x7	x8	y



Input layer Hidden layer 1 ... Hidden layer k Output layer

By noting i the i^{th} layer of the network and j the j^{th} hidden unit of the layer, we have:

$$z_j^{[i]} = w_j^{[i]^T} x + b_j^{[i]}$$

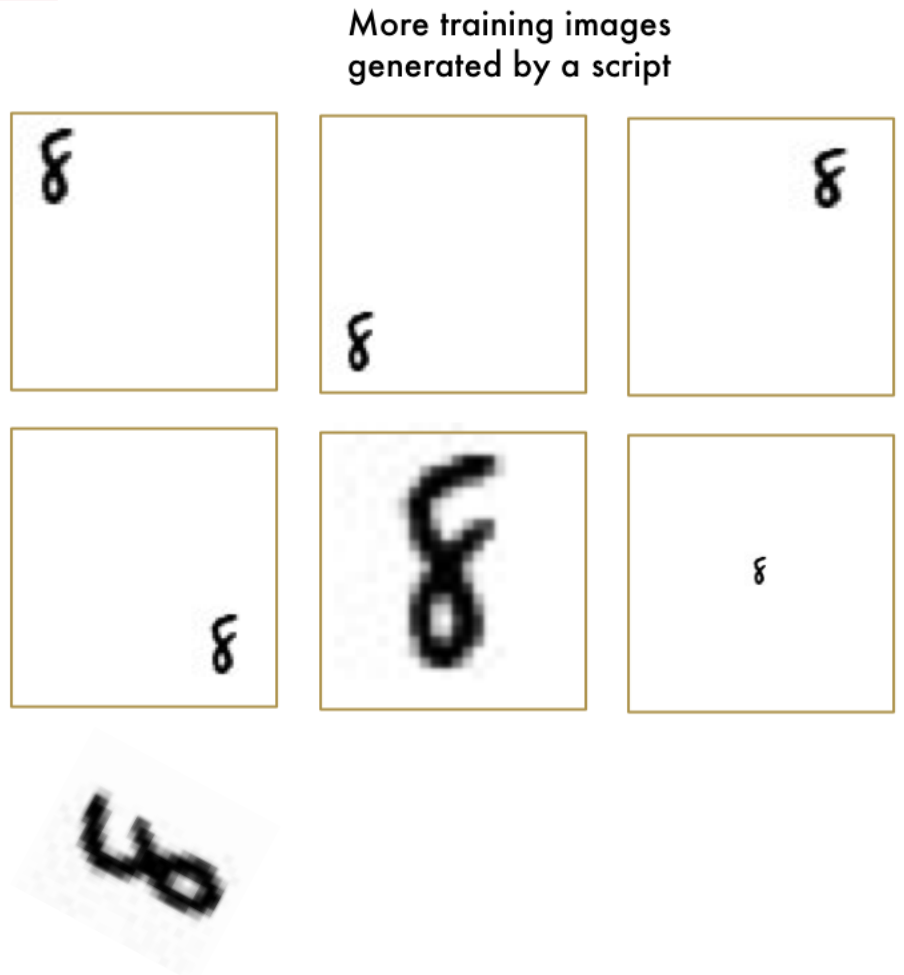
      zoom_range=0.2,
      horizontal_flip=True,
      fill_mode='nearest')

validation_datagen = ImageDataGenerator(rescale=1/255)
```



Week 9: Artificial Intelligent – CNN – Data processing

University of Salford MANCHESTER

- **Data augmentation**: Deep learning models usually need a lot of data to be properly trained. It is often useful to get more data from the existing ones using data augmentation techniques.

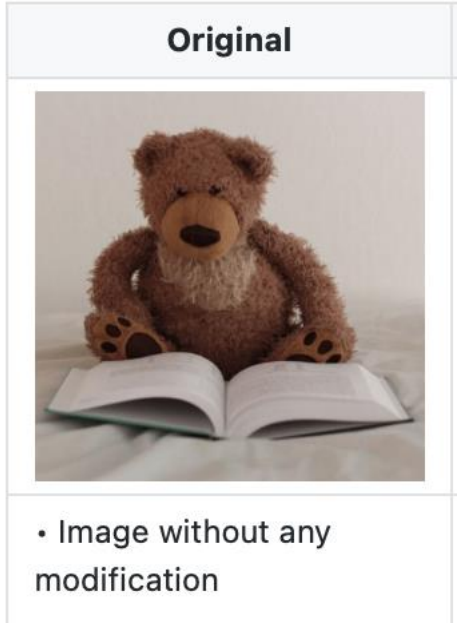
Session Code:
2675
9432

Week 9: Artificial Intelligent – CNN – Data processing

- **Data augmentation**: Deep learning models usually need a lot of data to be properly trained. It is often useful to get more data from the existing ones using data augmentation techniques.
- The main ones are summed up in the table below. More precisely, given the following input image,

Week 9: Artificial Intelligent – CNN – Data processing

- **Data augmentation**: Deep learning models usually need a lot of data to be properly trained. It is often useful to get more data from the existing ones using data augmentation techniques.
- The main ones are summed up in the table below. More precisely, given the following input image, here are the techniques that we can apply:



Week 9: Artificial Intelligent – CNN – Data processing

University of Salford MANCHESTER

Original	Flip	Rotation	Random crop
			
• Image without any modification	• Flipped with respect to an axis for which the meaning of the image is preserved	• Rotation with a slight angle • Simulates incorrect horizon calibration	• Random focus on one part of the image • Several random crops can be done in a row

Color shift	Noise addition	Information loss	Contrast change
			
• Nuances of RGB is slightly changed • Captures noise that can occur with light exposure	• Addition of noise • More tolerance to quality variation of inputs	• Parts of image ignored • Mimics potential loss of parts of image	• Luminosity changes • Controls difference in exposition due to time of day

Week 9: Artificial Intelligent – CNN – Modelling

University of Salford MANCHESTER

```
model = tf.keras.models.Sequential([
    tf.keras.layers.Conv2D(16, (3,3), activation='relu', input_shape=(300, 300, 3)),
    tf.keras.layers.MaxPooling2D(2, 2),
    tf.keras.layers.Conv2D(32, (3,3), activation='relu'),
    tf.keras.layers.MaxPooling2D(2,2),
    tf.keras.layers.Conv2D(64, (3,3), activation='relu'),
    tf.keras.layers.MaxPooling2D(2,2),
    tf.keras.layers.Conv2D(64, (3,3), activation='relu'),
    tf.keras.layers.MaxPooling2D(2,2),
    tf.keras.layers.Conv2D(64, (3,3), activation='relu'),
    tf.keras.layers.MaxPooling2D(2,2),
    tf.keras.layers.Flatten(),
    tf.keras.layers.Dense(512, activation='relu'),
    tf.keras.layers.Dense(1, activation='sigmoid')
])
```

Week 9: Artificial Intelligent – CNN – Training

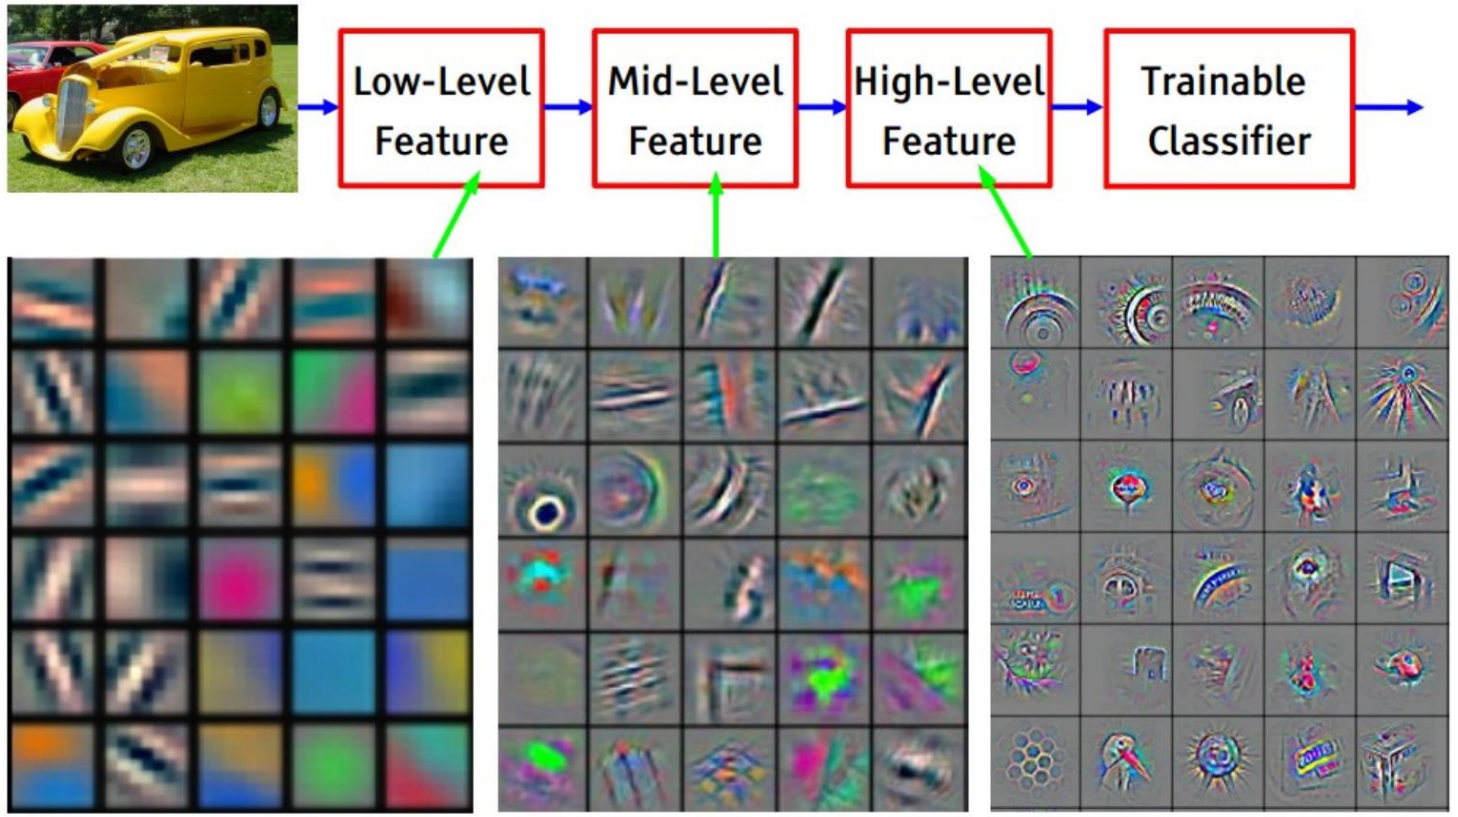
University of Salford MANCHESTER

from tensorflow.keras.optimizers import Adam, **SGD, RMSProp, RMSProp, Adagrad**

model.compile(loss='binary_crossentropy', optimizer=Adam, metrics=['accuracy'])

history = model.fit(train_generator, steps_per_epoch=8, epochs=30,verbose=1,
validation_data = validation_generator, validation_steps=8)

Week 9: Artificial Intelligent – CNN – Feature Detector



Feature visualization of convolutional net trained on ImageNet from [Zeiler & Fergus 2013]

model = keras.Model(inputs, outputs)
```

```
model.compile(optimizer=keras.optimizers.Adam(),
              loss=keras.losses.BinaryCrossentropy(from_logits=True),
              metrics=[keras.metrics.BinaryAccuracy()])
model.fit(new_dataset, epochs=20)
```

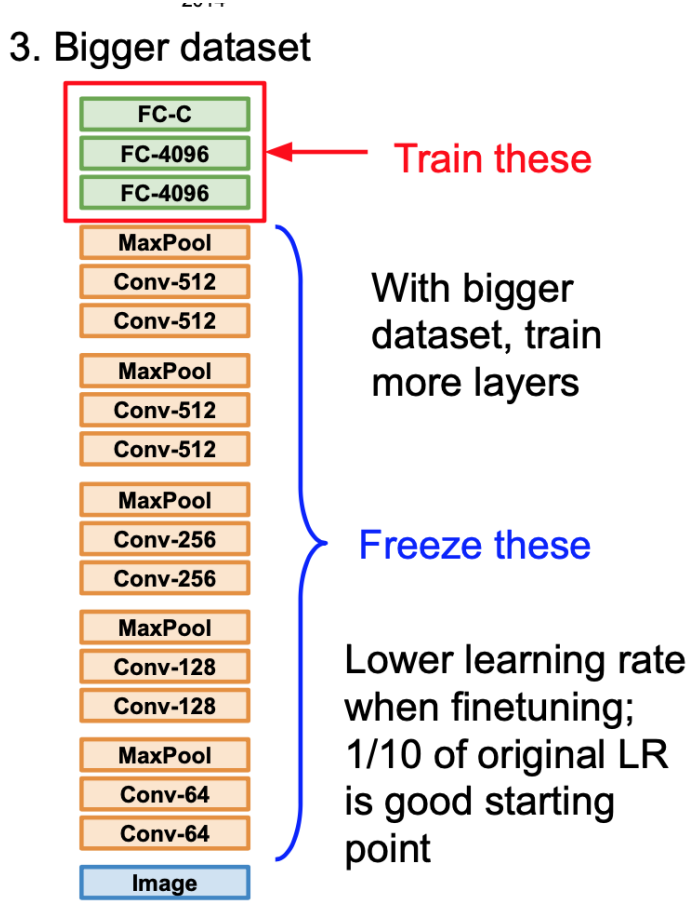
Week 9: Artificial Intelligent – CNN – Transfer Learning

University of Salford MANCHESTER

	very similar dataset	**very different dataset**
very little data	Use Linear Classifier on top layer	You're in trouble… Try linear classifier from different stages
quite a lot of data	Finetune a few layers	Finetune a larger number of layers

Week 9: Artificial Intelligent – CNN – Transfer Learning

base_model.trainable = True



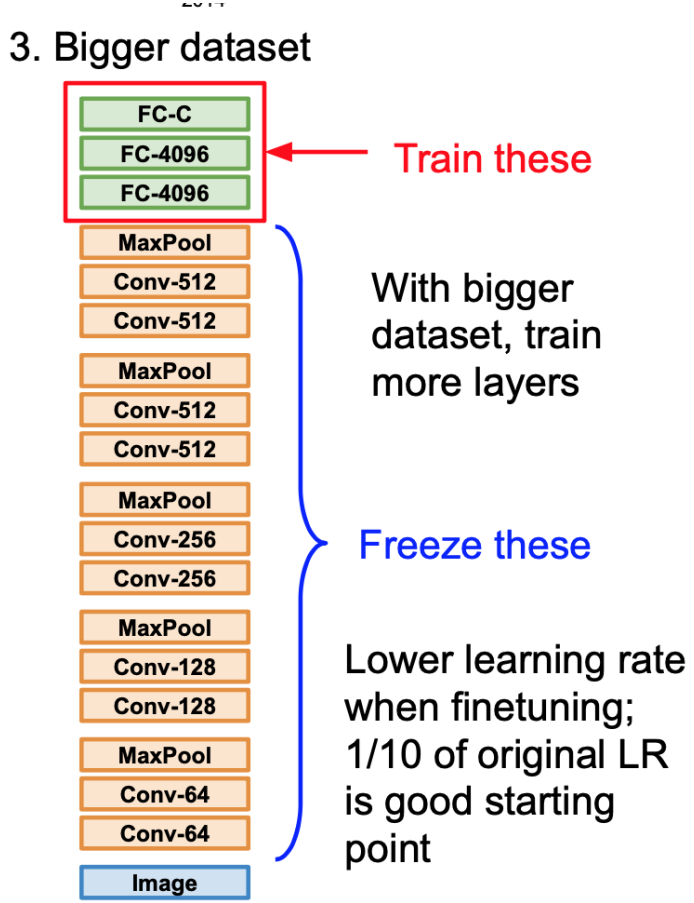
Week 9: Artificial Intelligent – CNN – Transfer Learning

```
base_model.trainable = True

# Let's take a look to see how many layers are in the base model
print("Number of layers in the base model: ",
len(base_model.layers))

# Fine-tune from this layer onwards
fine_tune_at = 100

# Freeze all the layers before the `fine_tune_at` layer
for layer in base_model.layers[:fine_tune_at]:
  layer.trainable =  False
```



Week 9: Artificial Intelligent – CNN – Transfer Learning

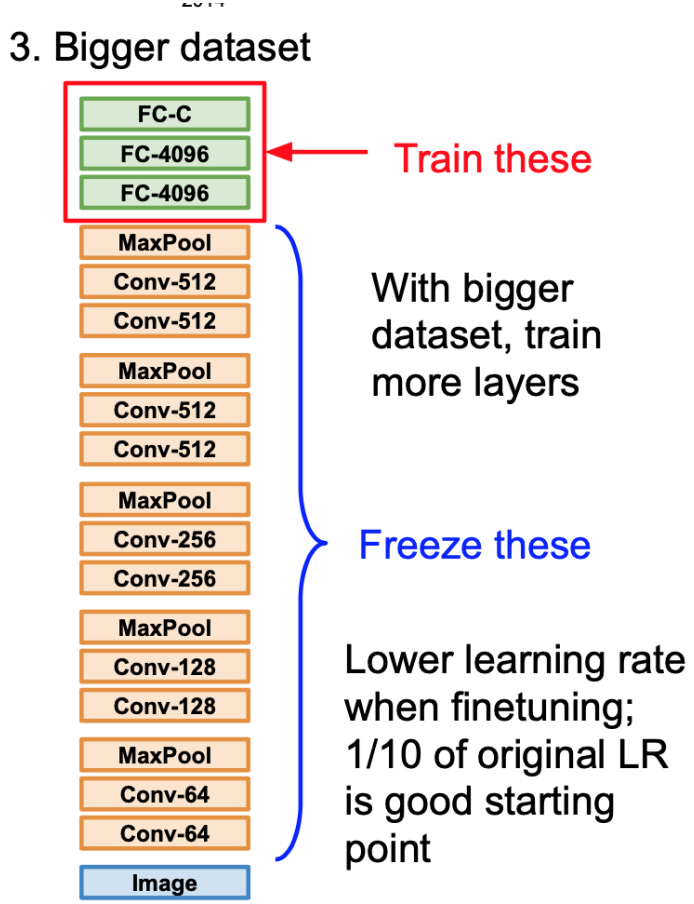
University of Salford MANCHESTER

```
base_model.trainable = True

len(base_model.layers))
fine_tune_at = 100
for layer in base_model.layers[:fine_tune_at]:
  layer.trainable =  False

model.compile(loss=tf.keras.losses.BinaryCrossentropy(from_logits=True),
          optimizer = tf.keras.optimizers.RMSprop(lr=base_learning_rate/10),
          metrics=['accuracy'])

history_fine = model.fit(train_dataset,
                         epochs=total_epochs,
                         initial_epoch=history.epoch[-1],
                         validation_data=validation_dataset)
```



Week 9: CNN – Object detection

University of Salford MANCHESTER

❑ **Types of models** — There are 3 main types of object recognition algorithms, for which the nature of what is predicted is different. They are described in the table below:

Image classification	Classification w. localization	Detection
		• Classifies a picture • Predicts probability of object	• Detects an object in a picture • Predicts probability of object and where it is located	• Detects up to several objects in a picture • Predicts probabilities of objects and where they are located
Traditional CNN	Simplified YOLO, R-CNN	YOLO, R-CNN

S. Ameen

Week 9: CNN – Object detection

University of Salford MANCHESTER

□ **Detection** — In the context of object detection, different methods are used depending on whether we just want to locate the object or detect a more complex shape in the image. The two main ones are summed up in the table below:

Bounding box detection	Landmark detection
• Detects the part of the image where the object is located	• Detects a shape or characteristics of an object (e.g. eyes) • More granular
	Box of center (b_x, b_y), height b_h and width b_w	Reference points (l_{1x}, l_{1y}), ..., (l_{nx}, l_{ny})

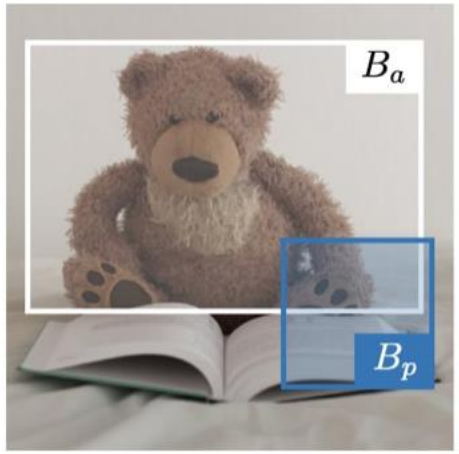
Week 9: CNN – Object detection

University of Salford MANCHESTER

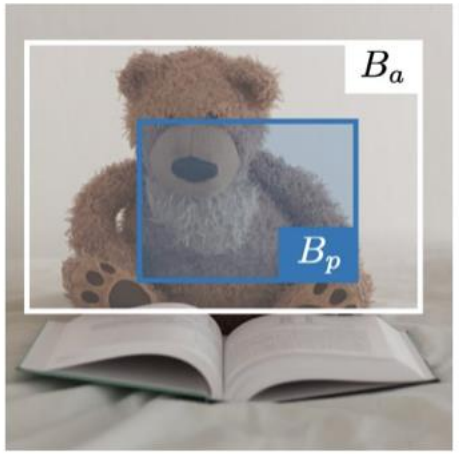
□ **Intersection over Union** — Intersection over Union, also known as IoU, is a function that quantifies how correctly positioned a predicted bounding box B_p is over the actual bounding box B_a. It is defined as:

$$\mathrm{IoU}(B_p, B_a) = \frac{B_p \cap B_a}{B_p \cup B_a}$$

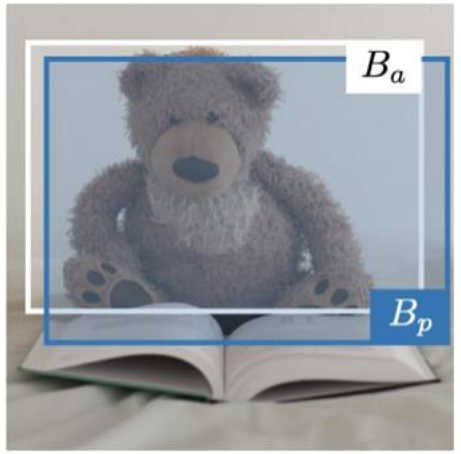
Remark: we always have $\mathrm{IoU} \in [0, 1]$. *By convention, a predicted bounding box* B_p *is considered as being reasonably good if* $\mathrm{IoU}(B_p, B_a) \geqslant 0.5$.



$\mathrm{IoU}(B_p, B_a) = 0.1$



$\mathrm{IoU}(B_p, B_a) = 0.5$

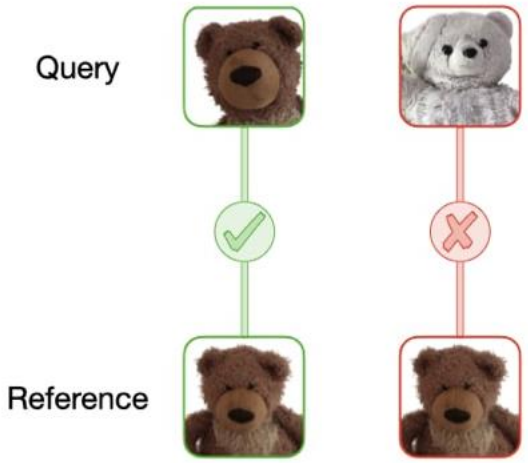


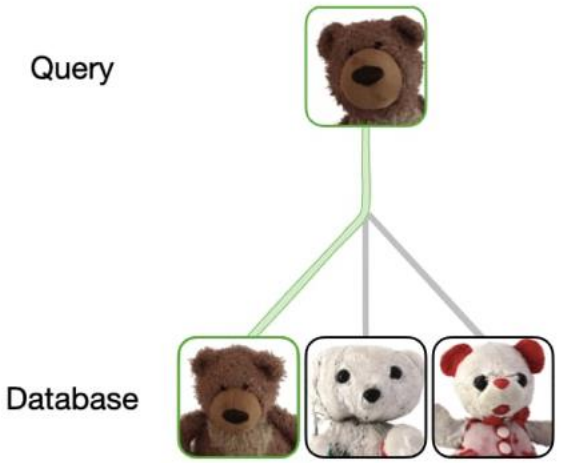
$\mathrm{IoU}(B_p, B_a) = 0.9$

Week 9: CNN – Face verification and recognition

University of Salford MANCHESTER

□ **Types of models** — Two main types of model are summed up in table below:

Face verification	Face recognition
• Is this the correct person? • One-to-one lookup	• Is this one of the K persons in the database? • One-to-many lookup
	




Week 9: CNN – Neural style transfer

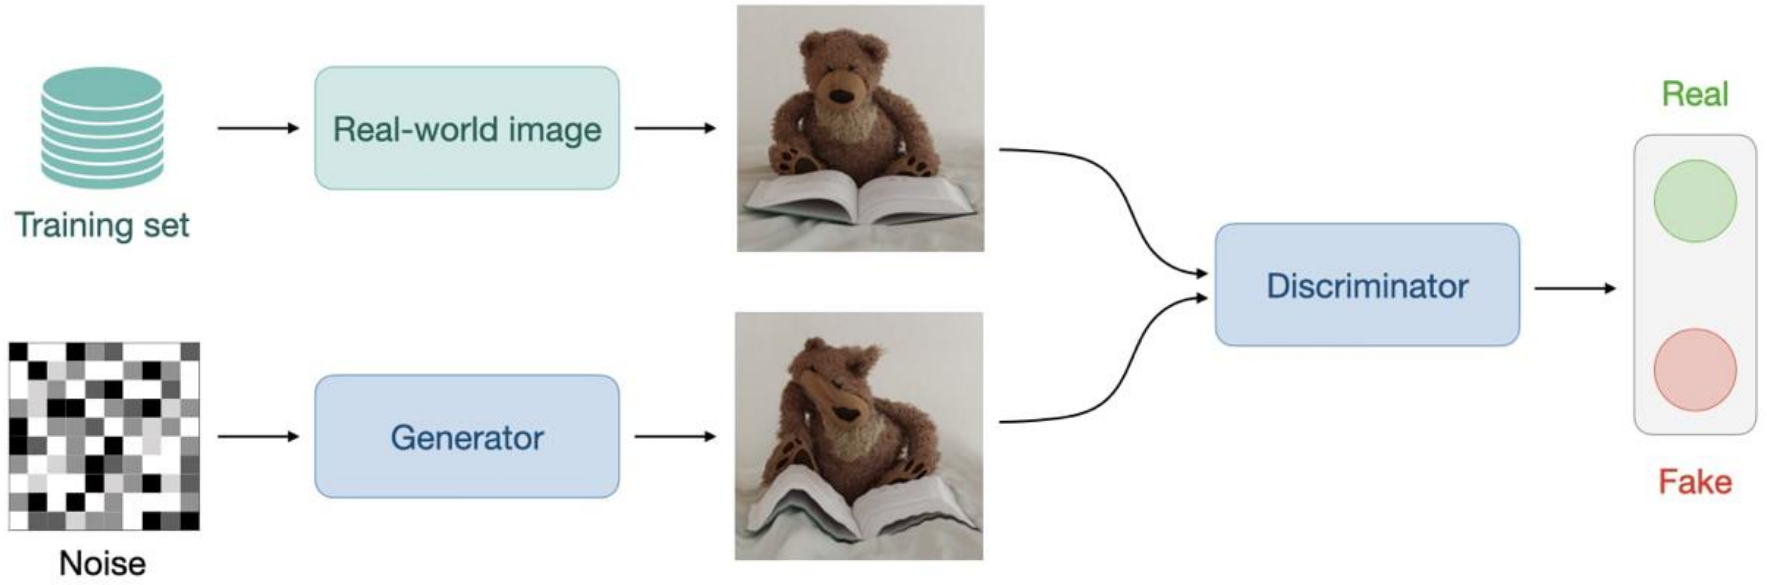
□ **Motivation** — The goal of neural style transfer is to generate an image G based on a given content C and a given style S.

Content C Style S Generated image G

Week 9: CNN – GAN

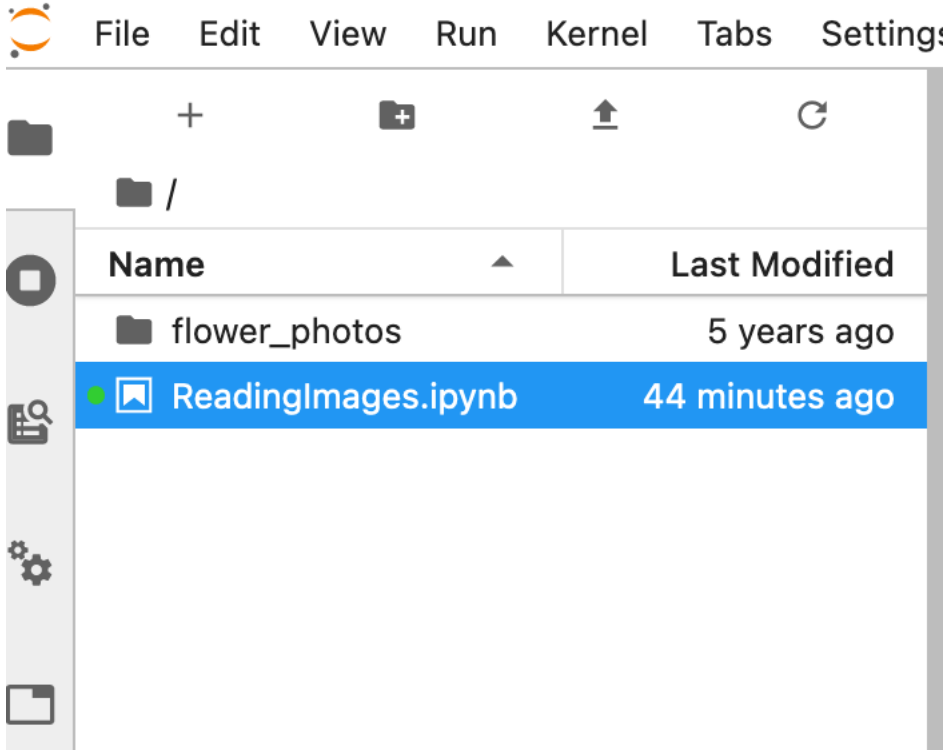
University of Salford MANCHESTER

❑ **Generative Adversarial Network** — Generative adversarial networks, also known as GANs, are composed of a generative and a discriminative model, where the generative model aims at generating the most truthful output that will be fed into the discriminative which aims at differentiating the generated and true image.

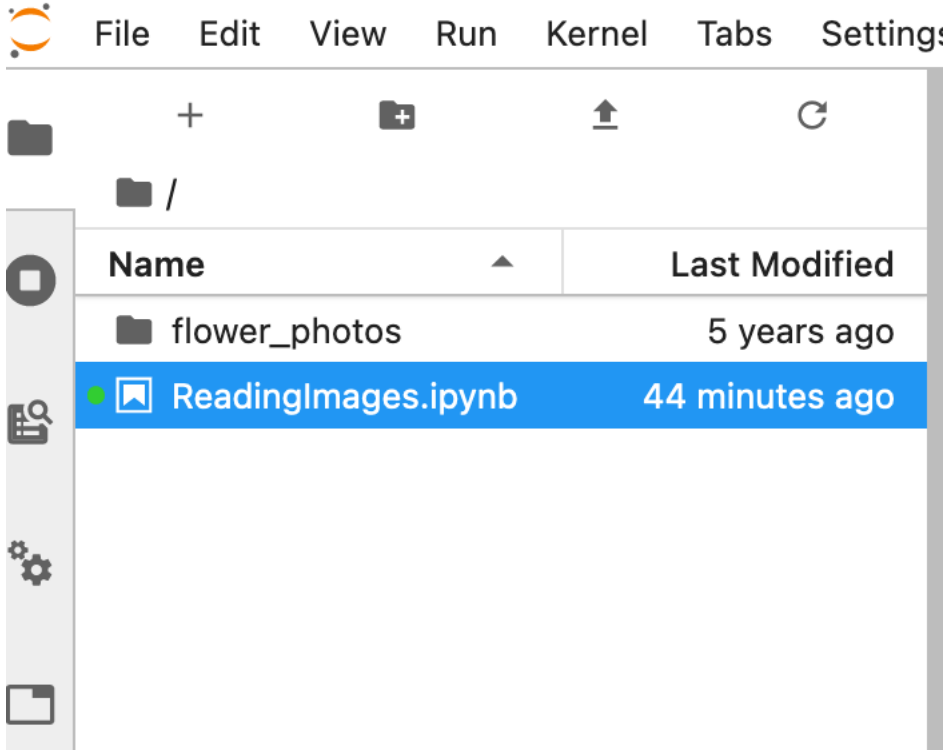


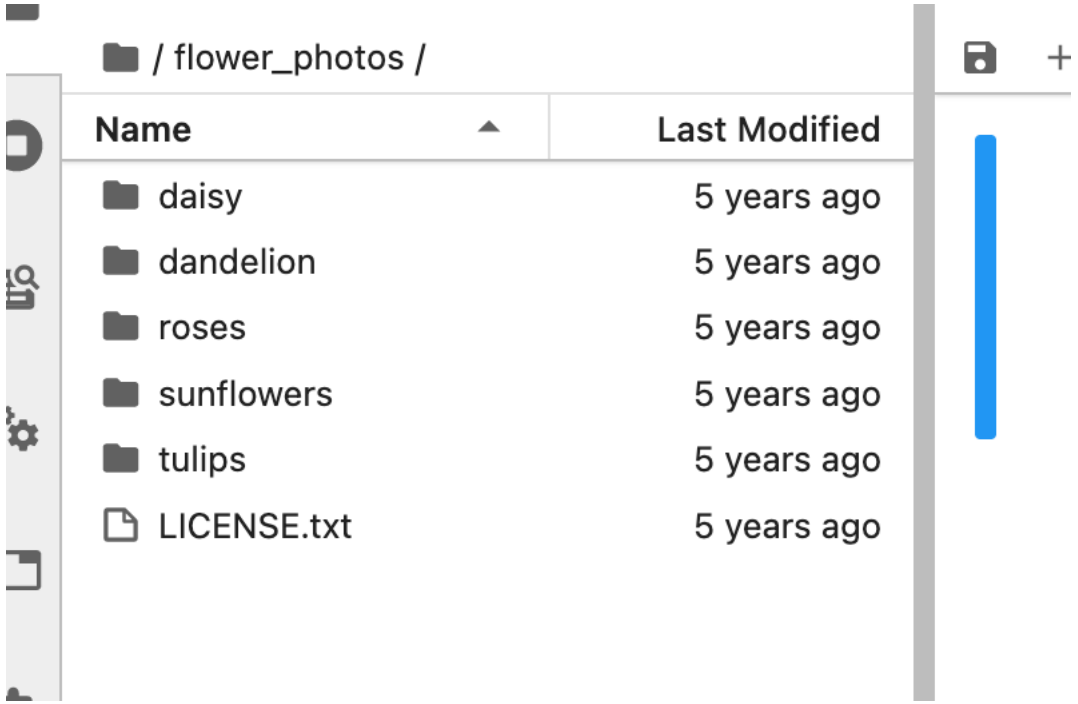
Remark: use cases using variants of GANs include text to image, music generation and synthesis.

Week 9 – Reading the Images



Week 9 – Reading the Images





Week 9 – Reading the Images

University of Salford MANCHESTER

[1]:
```

Week 9 – : Deep Learning
Applications of RNNs:

University of Salford MANCHESTER

RNN models are mostly used in the fields of natural language processing and speech recognition.

Type of RNN	Illustration	Example
One-to-one $T_x = T_y = 1$		Traditional neural network

Week 9 – : Deep Learning
Applications of RNNs:

RNN models are mostly used in the fields of natural language processing and speech recognition.

Type of RNN	Illustration	Example
One-to-many $T_x = 1, T_y > 1$		Music generation

Week 9 – : Deep Learning
Applications of RNNs:

University of Salford MANCHESTER

RNN models are mostly used in the fields of natural language processing and speech recognition.

Type of RNN	Illustration	Example
Many-to-one $T_x > 1, T_y = 1$		Sentiment classification

Week 9 – : Deep Learning
Applications of RNNs:

University of Salford MANCHESTER

RNN models are mostly used in the fields of natural language processing and speech recognition.

Type of RNN	Illustration	Example
Many-to-many $T_x = T_y$		Name entity recognition

Week 9 – : Deep Learning
Applications of RNNs:

University of Salford MANCHESTER

RNN models are mostly used in the fields of natural language processing and speech recognition.

Type of RNN	Illustration	Example
Many-to-many $T_x \neq T_y$		Machine translation

Week 9 – : Deep Learning
Applications of RNNs: Example

University of Salford MANCHESTER

```
from numpy import sqrt
from numpy import asarray
from tensorflow.keras.layers import LSTM

# split a univariate sequence into samples
def split_sequence(sequence, n_steps):
    X, y = list(), list()
    for i in range(len(sequence)):
        # find the end of this pattern
        end_ix = i + n_steps
        # check if we are beyond the sequence
        if end_ix > len(sequence)-1:
            break
        # gather input and output parts of the pattern
        seq_x, seq_y = sequence[i:end_ix], sequence[end_ix]
        X.append(seq_x)
        y.append(seq_y)
    return asarray(X), asarray(y)
```

```
# load the dataset
path = 'https://raw.githubusercontent.com/jbrownlee/Datasets/master/monthly-car-sales.csv'
df = read_csv(path, header=0, index_col=0, squeeze=True)
df.tail()
```

```
Month

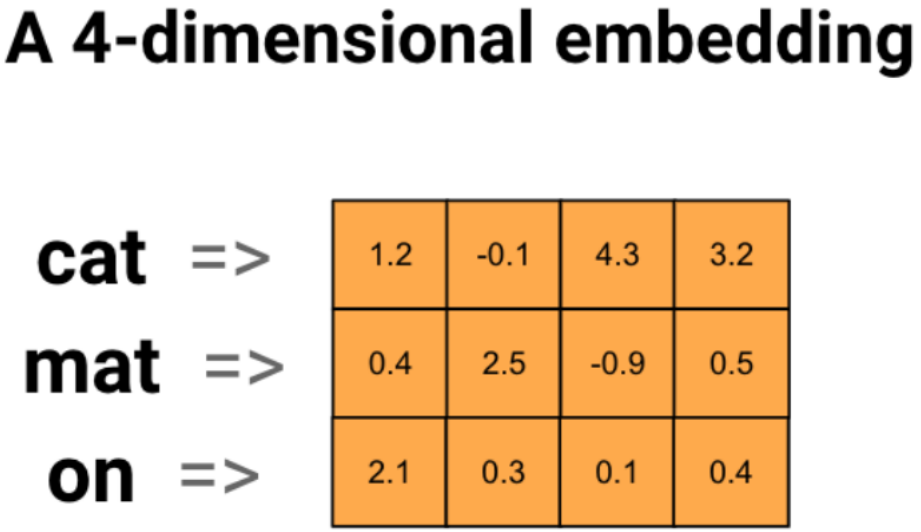
AND
hotel [0000000100000000] = 0

Week 9 : Deep Learning with NLP - Word embeddings

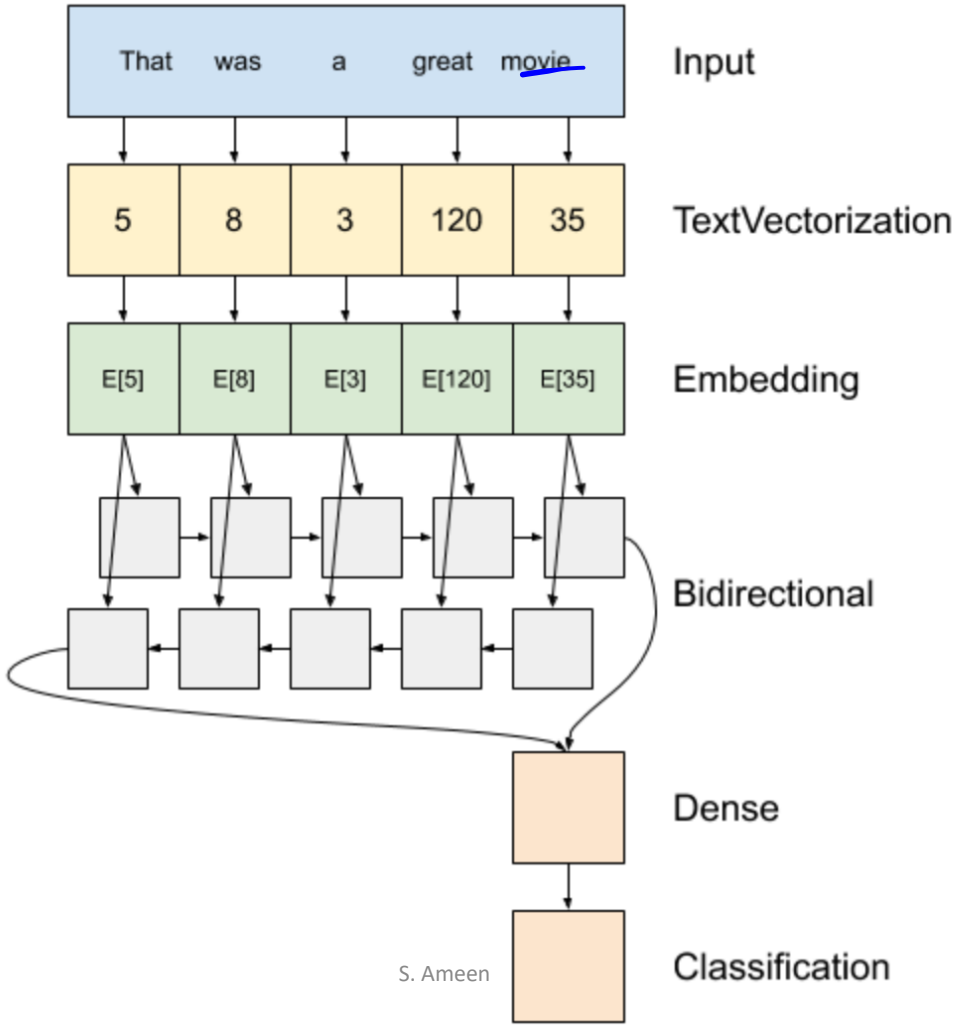
University of Salford MANCHESTER

Word embeddings

Word embeddings give us a way to use an efficient, dense representation in which similar words have a similar encoding.



Week 9 : Deep Learning with NLP - Word embeddings



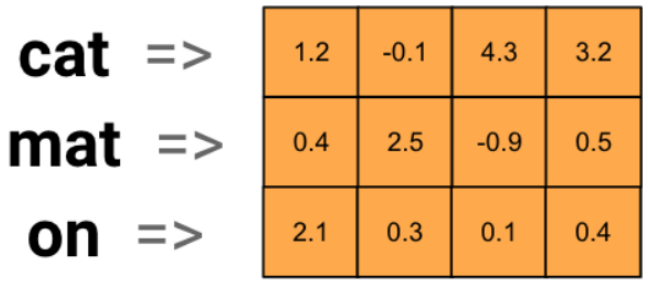
Week 9 : Deep Learning with NLP - Word embeddings

University of Salford MANCHESTER

```
import csv
import tensorflow as tf
import numpy as np
from tensorflow.keras.preprocessing.text import Tokenizer
from tensorflow.keras.preprocessing.sequence import pad_sequences
```

```
vocab_size = 1000
embedding_dim = 16
max_length = 120
trunc_type='post'
padding_type='post'
oov_tok = "<OOV>"
training_portion = .8
```

A 4-dimensional embedding



```
>>> sequence = [[1], [2, 3], [4, 5, 6]]
>>> tf.keras.preprocessing.sequence.pad_sequences(sequence)
array([[0, 0, 1],
       [0, 2, 3],
       [4, 5, 6]], dtype=int32)
```

```
>>> tf.keras.preprocessing.sequence.pad_sequences(sequence, value=-1)
array([[-1, -1,  1],
       [-1,  2,  3],
       [ 4,  5,  6]], dtype=int32)
```

```
>>> tf.keras.preprocessing.sequence.pad_sequences(sequence, padding='post')
array([[1, 0, 0],
       [2, 3, 0],
       [4, 5, 6]], dtype=int32)
```

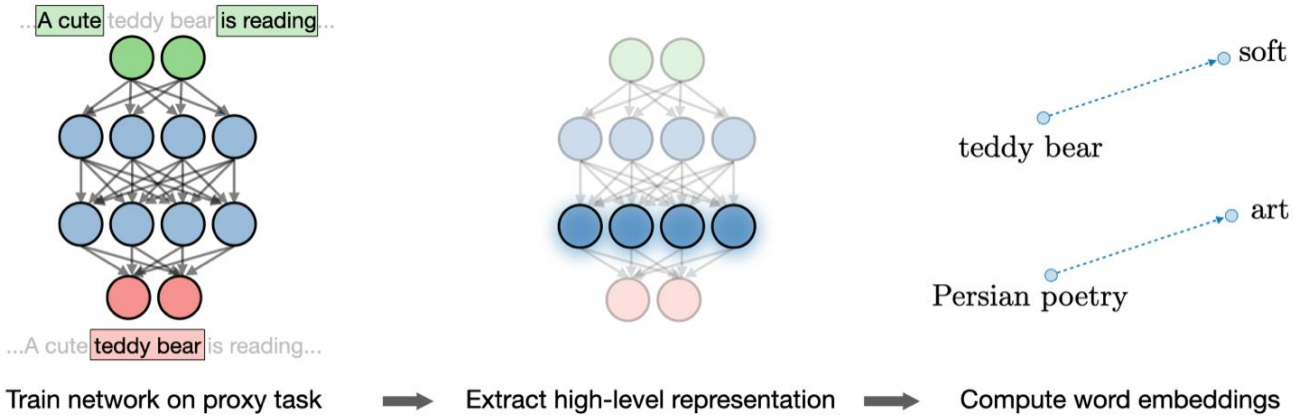
```
>>> tf.keras.preprocessing.sequence.pad_sequences(sequence, maxlen=2)
array([[0, 1],
       [2, 3],
       [5, 6]], dtype=int32)
```

Week 9 : Deep Learning with NLP - word2Vec

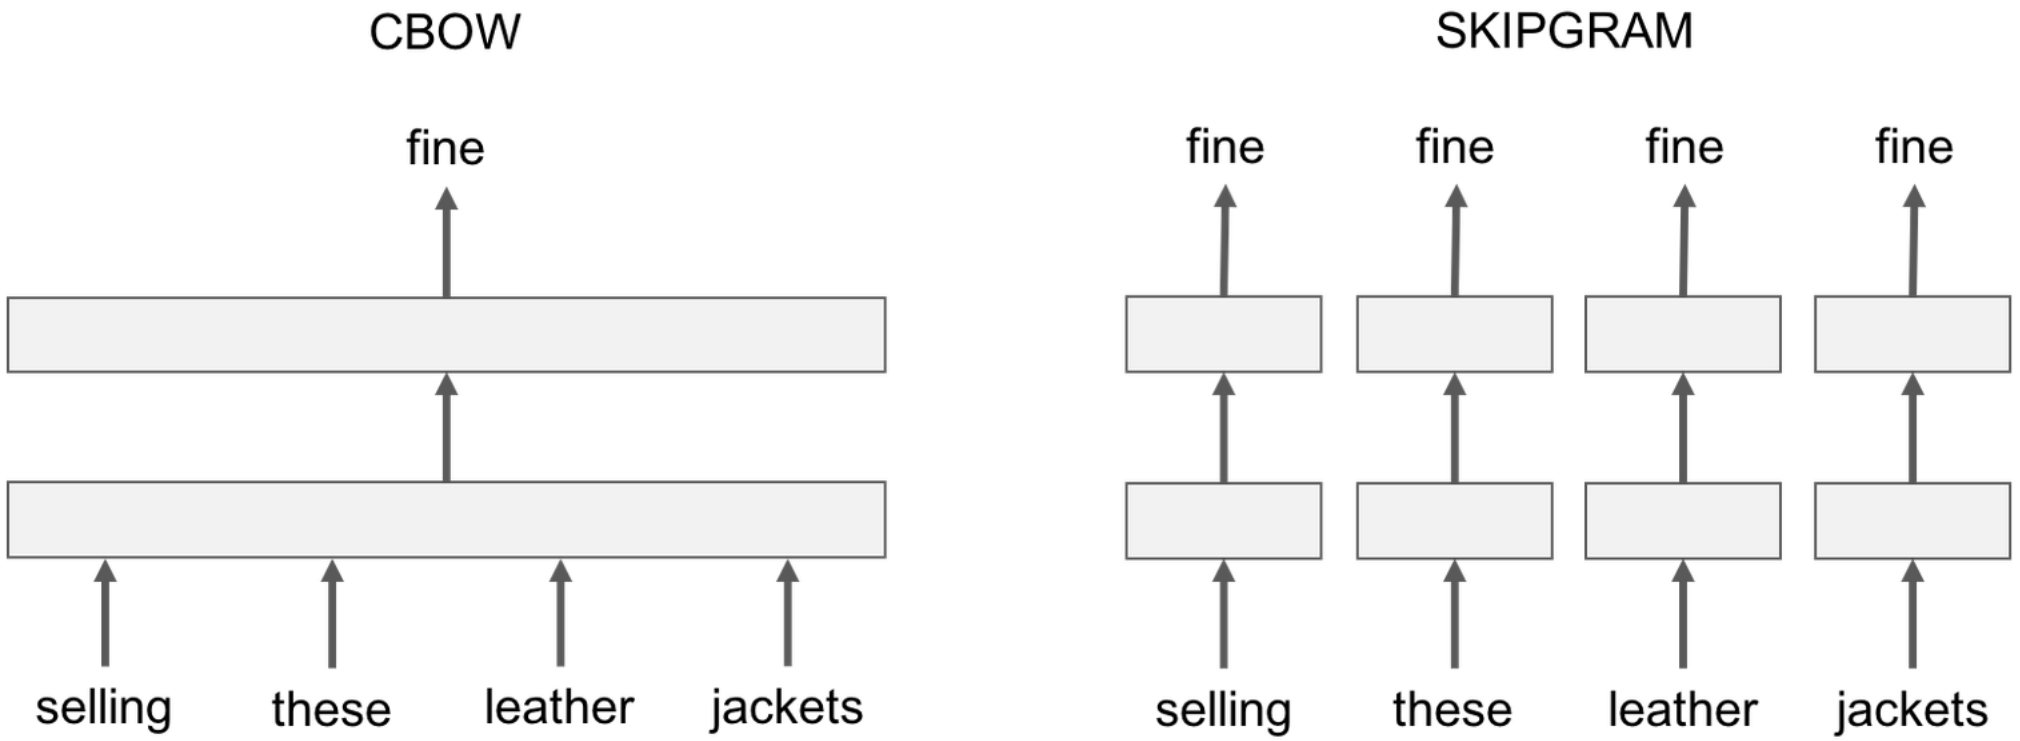
Word2Vec: There are two models that are commonly used to train these embeddings:

The Skip-gram model takes the input as each word in the corpus, sends them to a hidden layer (embedding layer) and from there it predicts the context words. Once trained, the embedding for a particular word is obtained by feeding the word as input and taking the hidden layer value as the final embedding vector.

The CBOW (Continuous Bag of Words) model takes the input the context words for the given word, sends them to a hidden layer (embedding layer) and from there it predicts the original word. Once again, after training, the embedding for a particular word is obtained by feeding the word as input and taking the hidden layer value as the final embedding vector.



Week 9 : Deep Learning with NLP – CBOW vs Skipgram



Week 9 : Deep Learning with NLP - GloVe: Global Vectors for Word Representation

University of Salford MANCHESTER

GloVe is an unsupervised learning algorithm for obtaining vector representations for words. Training is performed on aggregated global word-word co-occurrence statistics from a corpus, and the resulting representations showcase interesting linear substructures of the word vector space.

$$J(\theta) = \frac{1}{2} \sum_{i,j=1}^{W} f(P_{ij})(u_i^T v_j - \log P_{ij})^2$$

Week 9 : Deep Learning with NLP - GloVe:

Nearest words to frog:

1. frogs
2. toad

```

Week 9 : Deep Learning with NLP : Application : - Algebraic Geometry (Latex)

Proof. Omitted. □

Lemma 0.1. *Let $\mathcal{C}$ be a set of the construction.*

Let $\mathcal{C}$ be a gerber covering. Let $\mathcal{F}$ be a quasi-coherent sheaves of $\mathcal{O}$-modules. We have to show that

$$\mathcal{O}_{\mathcal{O}_X} = \mathcal{O}_X(\mathcal{L})$$

.

Proof. This is an algebraic space with the composition of sheaves $\mathcal{F}$ on $X_{\acute{e}tale}$ we have

$$\mathcal{O}_X(\mathcal{F}) = \{morph_1 \times_{\mathcal{O}_X} (\mathcal{G}, \mathcal{F})\}$$

where $\mathcal{G}$ defines an isomorphism $\mathcal{F} \to \mathcal{F}$ of $\mathcal{O}$-modules. □

Lemma 0.2. *This is an integer $\mathcal{Z}$ is injective.*

Proof. See Spaces, Lemma ??. □

Lemma 0.3. *Let S be a scheme. Let X be a scheme and X is an affine open covering. Let $\mathcal{U} \subset \mathcal{X}$ be a canonical and locally of finite type. Let X be a scheme. Let X be a scheme which is equal to the formal complex.*

The following to the construction of the lemma follows.

Let X be a scheme. Let X be a scheme covering. Let

$$b : X \to Y' \to Y \to Y \to Y' \times_X Y \to X.$$

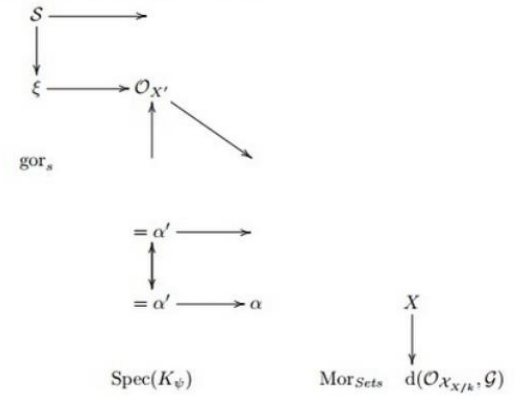
be a morphism of algebraic spaces over S and Y.

Proof. Let X be a nonzero scheme of X. Let X be an algebraic space. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. The following are equivalent

(1) $\mathcal{F}$ is an algebraic space over S.
(2) If X is an affine open covering.

Consider a common structure on X and X the functor $\mathcal{O}_X(U)$ which is locally of finite type. □

This since $\mathcal{F} \in \mathcal{F}$ and $x \in \mathcal{G}$ the diagram



is a limit. Then $\mathcal{G}$ is a finite type and assume S is a flat and $\mathcal{F}$ and $\mathcal{G}$ is a finite type f_*. This is of finite type diagrams, and

- the composition of $\mathcal{G}$ is a regular sequence,
- $\mathcal{O}_{X'}$ is a sheaf of rings.

□

Proof. We have see that $X = \mathrm{Spec}(R)$ and $\mathcal{F}$ is a finite type representable by algebraic space. The property $\mathcal{F}$ is a finite morphism of algebraic stacks. Then the cohomology of X is an open neighbourhood of U. □

Proof. This is clear that $\mathcal{G}$ is a finite presentation, see Lemmas ??.
A *reduced above* we conclude that U is an open covering of $\mathcal{C}$. The functor $\mathcal{F}$ is a "field

$$\mathcal{O}_{X,x} \longrightarrow \mathcal{F}_{\overline{x}} \quad \text{-1}(\mathcal{O}_{X_{\acute{e}tale}}) \longrightarrow \mathcal{O}_{X_t}^{-1}\mathcal{O}_{X_\lambda}(\mathcal{O}_{X_\eta}^{\overline{v}})$$

is an isomorphism of covering of $\mathcal{O}_{X_t}$. If $\mathcal{F}$ is the unique element of $\mathcal{F}$ such that X is an isomorphism.
The property $\mathcal{F}$ is a disjoint union of Proposition ?? and we can filtered set of presentations of a scheme $\mathcal{O}_X$-algebra with $\mathcal{F}$ are opens of finite type over S.
If $\mathcal{F}$ is a scheme theoretic image points. □

If $\mathcal{F}$ is a finite direct sum $\mathcal{O}_{X_\lambda}$ is a closed immersion, see Lemma ??. This is a sequence of $\mathcal{F}$ is a similar morphism.

Week 9 : Deep Learning with NLP : Application : - Linux Source Code

Inspired by the work of **Andrej Karpathy blog** for training multi-layer Recurrent Neural Network (RNN, LSTM, and GRU) and then sampling form the model. I trained **char-rnn** to many of Arabic poems and surprisingly the network can match Arabic diacritics which is difficult to match to many people but the network learns to generate them. I trained the file with size of nearly 93MB. LSTM with 3 layers, the size of the network 700, 0.5 dropout while number of parameters in the model: 10341950

Week 9 : Deep Learning with NLP : Application : - Poem

Week 9 : AI

- Thank You
